What Is Security?

Computer Security

The protection afforded to an automated information system in order to attain the applicable objectives of preserving the integrity, availability, and confidentiality o information system resources.

NIST Computer Security Handbook

Network and Internet Security

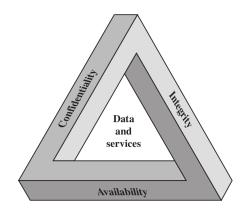

Measures to deter, prevent, detect, and correct security violations that involve transmission of information.

Stallings, Cryptography and Network Security

Impact of Security Breaches

How do security breaches impact organisations?

- Effectiveness of primary operations are reduced
- ► Financial loss
- Damage to assets
- ► Harm to individuals

Different levels of impact. E.g. FIPS Publication 199 defines: Low/Minor, Moderate/Significant, High/Severe

ITU-T X.800 Security Architecture for OSI

- Systematic approach to define requirements for security and approaches to satisfying those requirements
- ► ITU-T Recommendation X.800, Security Architecture for OSI
- Provides abstract view of main issues of security
- Security aspects: Attacks, mechanisms and services
- Terminology:
 - ► Threat: potential violation of security
 - Attack: assault on system security derived from intelligent threat

Architecture

Aspects of Security

Security Attack

Any action that attempts to compromise the security of information or facilities

▶ Threat: potential for violation of security of information or facilities

Security Mechanism

A method for preventing, detecting or recovering from an attack

Security Service

Uses security mechanisms to enhance the security of information or facilities in order to stop attacks

Attacks

Mechanish

Types of Attacks

Passive Attack

- Make use of information, but not affect system resources, e.g.
 - 1. Release message contents
 - 2. Traffic analysis
- Relatively hard to detect, but easier to prevent

Active Attack

- Alter system resources or operation, e.g.
 - 1. Masquerade
 - 2. Replay
 - 3. Modification
 - 4. Denial of service
- ▶ Relatively hard to prevent, but easier to detect

Services

Mechanism

Mode

Defining a Security Service

- ▶ ITU-T X.800: service that is provided by a protocol layer of communicating systems and that ensures adequate security of the systems or of data transfers
- ▶ IETF RFC 2828: a processing or communication service that is provided by a system to give a specific kind of protection to system resources
- Security services implement security policies and are implemented by security mechanisms

Services

Mechanism

Mode

Security Services

- Authentication Assure that the communicating entity is the one that it claims to be. (Peer entity and data origin authentication)
- 2. Access Control Prevent unauthorised use of a resource
- 3. Data Confidentiality Protect data from unauthorised disclosure
- 4. Data Integrity Assure data received are exactly as sent by authorised entity
- Nonrepudiation Protect against denial of one entity involved in communications of having participated in communications
- 6. Availability System is accessible and usable on demand by authorised users according to intended goal

Services

Mechanisms

Mode

Security Mechanisms

- Techniques designed to prevent, detect or recover from attacks
- ▶ No single mechanism can provide all services
- ► Common in most mechanisms: cryptographic techniques
- Specific security mechanisms from ITU-T X.800: Encipherment, digital signature, access control, data integrity, authentication exchange, traffic padding, routing control, notarization
- Pervasive security mechanisms from ITU-T X.800:
 Trusted functionality, security label, event detection, security audit trail, security recovery
