#### Transport Security

Web Security TLS/SSL HTTPS

## Web Security Issues

- Original Internet protocols do not have built-in security (IP, TCP, HTTP, ...)
- Many threats arise for web and other Internet applications
- Issues at: client, server and traffic between client and server

► Cover: SSL/TLS, SSH, IPsec

#### Transport Security

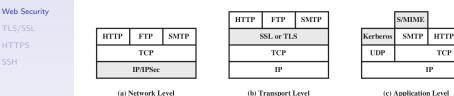

Web Security TLS/SSL HTTPS

### Comparison of Threats on the Web

	Threats	Consequences	Countermeasures
Integrity	<ul> <li>Modification of user data</li> <li>Trojan horse browser</li> <li>Modification of memory</li> <li>Modification of message traffic in transit</li> </ul>	<ul> <li>Loss of information</li> <li>Compromise of machine</li> <li>Vulnerabilty to all other threats</li> </ul>	Cryptographic checksums
Confidentiality	•Eavesdropping on the net •Theft of info from server •Theft of data from client •Info about network configuration •Info about which client talks to server	•Loss of information •Loss of privacy	Encryption, Web proxies
Denial of Service	•Killing of user threads •Flooding machine with bogus requests •Filling up disk or memory •Isolating machine by DNS attacks	•Disruptive •Annoying •Prevent user from getting work done	Difficult to prevent
Authentication	<ul> <li>Impersonation of legitimate users</li> <li>Data forgery</li> </ul>	<ul> <li>Misrepresentation of user</li> <li>Belief that false information is valid</li> </ul>	Cryptographic techniques

### CSS322 Transport Security

# Security Options in $\mathsf{TCP}/\mathsf{IP}$

- IPsec: Security for IP datagrams; general solution for all Internet traffic; implemented in OS
- SSL/TLS: Security for TCP segments; general solution for all TCP-based applications; implemented in libraries/applications (e.g. OpenSSL)
- Application-specific: Security for application messages; specific to each applications; implemented in single application

# SSL and TLS

 Secure Sockets Layer (SSL) originated in Netscape web browser

- Transport Layer Security (TLS) standardised by IETF
- SSLv3 and TLS are almost the same
- SSL provides security services to application layer protocols using TCP
- SSL architecture consists of multiple protocols

### SSL Architecture

#### Transport Security

Web Security

TLS/SSL

....

SSL Handshake Protocol	SSL Change Cipher Spec Protocol	SSL Alert Protocol	НТТР
SSL Record Protocol			
ТСР			
IP			

Record: provides confidentiality and message integrity

Handshake: authenticate entities, negotiate parameter values

Change Cipher: change cipher for use in connection Alert: alert peer entity of status/warning/error

#### Transport Security

Web Security

TLS/SSL HTTPS

SSH

# Connections and Sessions

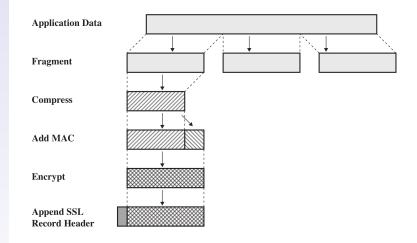

- SSL connection corresponds with TCP connection
  - Client and server may have multiple connections
- SSL session is association between client and server
  - Session created with Handshake protocol
  - Multiple connections can be associated with one session
  - Security parameters for session can be shared for connections
- State information is stored after Handshake protocol
  - Session: ID, certificate, compression, cipher spec, master secret, ...
  - Connection: random values, encrypt keys, MAC secrets, IV, sequence numbers, ...

#### Transport Security

SSH

## SSL Record Protocol Operation

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

#### Transport Security

Web Security

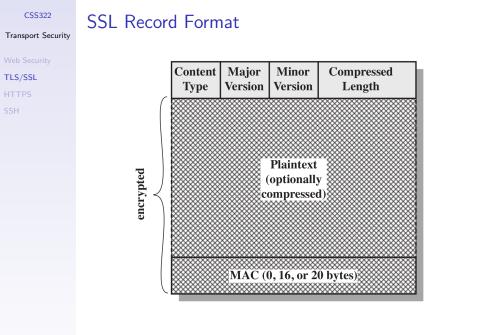

TLS/SSL HTTPS

SSH

# SSL Record Protocol

- Fragmentation: maximum fragment size is 16384 Bytes
- Compression: lossless; algorithm chosen in Handshake
- MAC: HMAC applied on compressed data; MAC secret key for connection used; MAc appended to compressed fragment
- Encrypt: applied to compressed fragment and MAC; algorithm chosen in Handshake
- SSL record header:
  - Content type: higher layer protocol (change cipher spec, alert, handshake, application)

- Version
- Compressed length in bytes

### CSS322 Transport Security

TLS/SSL

## SSL Record Protocol Payload

1 byte	1 byte	-	≥ 0 bytes
1	Туре	Length	Content
(a) Change Cipher Spec Protocol		(c) Hand	ishake Protocol
1 byte 1 byte		≥ 1 byt	e
Level Alert		OpaqueCo	ntent

(b) Alert Protocol

(d) Other Upper-Layer Protocol (e.g., HTTP)

#### Transport Security

Web Security

TLS/SSL HTTPS

SSH

## SSL Handshake Protocol

- Allow client and server to authenticate each other
- Negotiate encryption and MAC algorithms, exchange keys
  - Key Exchange: RSA, Diffie-Hellman
  - MAC: HMAC using SHA or MD5
  - Encryption: RC4, RC2, DES, 3DES, IDEA, AES
- Multiple phases:
  - 1. Establish security capabilities: client proposes algorithms, server selects one

- 2. Server authentication and key exchange
- 3. Client authentication and key exchange
- 4. Finish setting up connection

#### Transport Security

Web Security

TLS/SSL HTTPS SSH

# SSL Handshake Protocol Messages

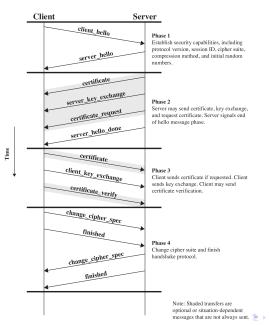

Message Type	Parameters
hello_request	null
client_hello	version, random, session id, cipher suite, compression method
server_hello	version, random, session id, cipher suite, compression method
certificate	chain of X.509v3 certificates
server_key_exchange	parameters, signature
certificate_request	type, authorities
server_done	null
certificate_verify	signature
client_key_exchange	parameters, signature
finished	hash value

#### Transport Security

Web Security TLS/SSL HTTPS

## HTTPS

- ► HTTPS: HTTP over SSL (or TLS)
- URL uses https://
- Web server listens on port 443
- Encrypt: URL of requested document, contents of document, contents of browser forms, cookies, contents of HTTP header
- Server is authenticated using certificate (using SSL)
- Client is authenticated using password (using HTTP)

Web Security TLS/SSL HTTPS SSH

# Secure Shell

- ► TELNET provides a remote login facility; insecure
- Secure Shell (SSH) designed for secure remote login
- SSH also supports secure file transfer and tunnelling

- SSHv2 developed by IETF
- SSH architecture consists of 3 protocols

### SSH Protocol Stack

#### Transport Security

Web Security

SSH

### SSH User SSH Authentication Protocol **Connection Protocol** Multiplexes the encrypted Authenticates the client-side tunnel into several logical user to the server. channels. **SSH Transport Layer Protocol** Provides server authentication, confidentiality, and integrity. It may optionally also provide compression. TCP Transmission control protocol provides reliable, connectionoriented end-to-end delivery. IP Internet protocol provides datagram delivery across multiple networks.

#### Transport Security

Web Security TLS/SSL HTTPS SSH

### SSH Authentication

### Server Authentication

- Server has public/private key pair
- Assume client knows server's public key
- During key exchange, server signs message with public key

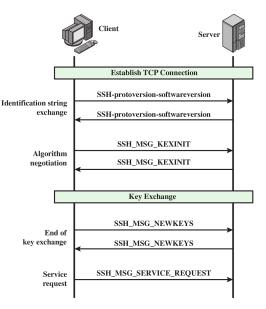

### **Client Authentication**

- Key-based: client has public/private key pair; server knows client public key
- Password-based: client sends password (encrypted); server knows password

### CSS322 Transport Security

### SSH Transport Layer Packet Exchange

#### Transport Security

Web Security TLS/SSL HTTPS SSH

## SSH Transport Layer Protocol

- Identification string exchange: each entity identifies protocol and software version
- Algorithm negotiation: client and server send list of supported algorithms, in order of preference; first common algorithm chosen
- Key exchange: Diffie-Hellman
- End of key exchange: new keys generated from shared secret, e.g.

$$K_{c2s} = Hash(K||H||'C'||session_id)$$

where

 $H = Hash(ID_C||ID_C||M_C||M_S||PU_S||Y_A||Y_B||K)$ 

 Service request for User Authentication or Connection Protocol

#### Transport Security

Web Security TLS/SSL HTTPS SSH

Cipher		
3des-cbc*	Three-key 3DES in CBC mode	
blowfish-cbc	Blowfish in CBC mode	
twofish256-cbc	Twofish in CBC mode with a 256-bit key	
twofish192-cbc	Twofish with a 192-bit key	
twofish128-cbc	Twofish with a 128-bit key	
aes256-cbc	AES in CBC mode with a 256-bit key	
aes192-cbc	AES with a 192-bit key	
aes128-cbc**	AES with a 128-bit key	
Serpent256-cbc	Serpent in CBC mode with a 256-bit key	
Serpent192-cbc	Serpent with a 192-bit key	
Serpent128-cbc	Serpent with a 128-bit key	
arcfour	RC4 with a 128-bit key	
cast128-cbc	CAST-128 in CBC	

SSH Algorithms

MAC algorithm	
hmac-sha1*	HMAC-SHA1; digest length = key length = 20
hmac-sha1-96**	First 96 bits of HMAC- SHA1; digest length = 12; key length = 20
hmac-md5	HMAC-SHA1; digest length = key length = 16
hmac-md5-96	First 96 bits of HMAC- SHA1; digest length = 12; key length = 16

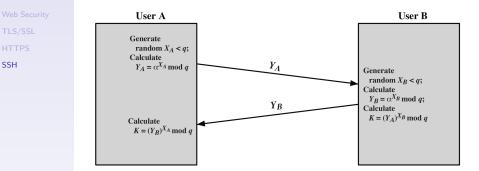

Compression algorithm	
none*	No compression
zlib	Defined in RFC 1950 and RFC 1951

\* = Required

\*\* = Recommended

### CSS322 Transport Security

## Key Exchange with Diffie-Hellman

#### Transport Security

Web Security TLS/SSL HTTPS SSH

# SSH Key Exchange with Diffie-Hellman

- SSH notation: q = P,  $\alpha = G$ ,  $Y_A = e$ ,  $Y_B = f$
- ID string for client and server: ID<sub>C</sub>, ID<sub>S</sub>;
   SSH\_MSG\_KEXINIT message from client and server: M<sub>C</sub>, M<sub>S</sub>
- Server key pair: (PU<sub>S</sub>, PR<sub>S</sub>); assume client knows/trusts PU<sub>S</sub>
- Client and server have agreed upon hash and encryption algorithms

a and b are application port numbers

### CSS322 Transport Security

SSH

## SSH Tunnel over TCP Connection

x and y are application port numbers, a and b are port numbers used by SSH

▲ロト ▲周ト ▲ヨト ▲ヨト ヨー のくで

#### Transport Security

Web Security TLS/SSL HTTPS SSH

## SSH Tunnels

- Allow normal (unsecured) applications to securely transfer data
- Bypass firewalls by using different ports
- Local forwarding: traffic to local port is sent via SSH client to remote port
- Remote forwarding: traffic to remote port is sent via SSH server to local port

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()
